

Wilson endpoints: one clock, distinguishable probes

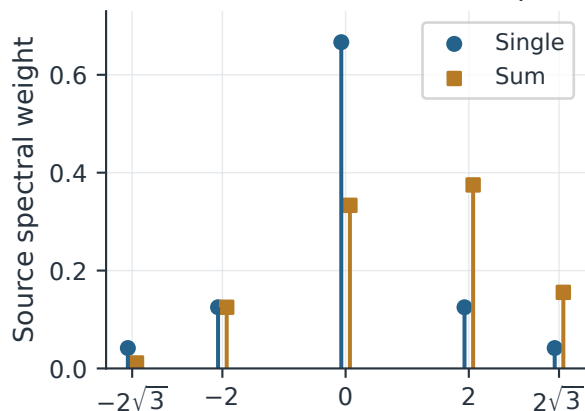

A Quadratic real response

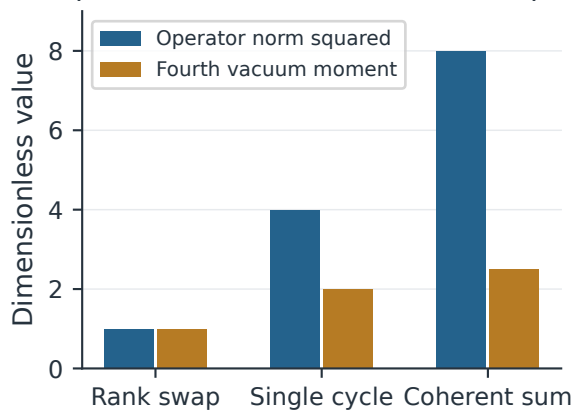

B Linear signed response

C More than one reached frequency

D Equal variance does not fix the operator

Adjacency eigenvalue (phase = eigenvalue $\times$ z/84)

Actual multiplier endpoints, $0 \leq z \leq 10^{-6}$. The elementary face is a null probe at this clock.

The coherent sum shares the rank-swap endpoint scalar, but its norm squared is 8 and fourth vacuum moment is 5/2.

Curves evaluate exact limiting formulas. They do not include finite-q remainders, physical clock calibration or measured data.
