

Complete support controls the available time window

A Strict region: $\gamma < 3(1 - \beta)$

B Exact support budget evaluated

Canonical summable family, $\eta = 1/2$, $C = \ell = 1$; $L = \max(1, \text{floor}(\varepsilon^{-\beta}))$.

Boundary curves are excluded from the vanishing certificate. A positive or divergent upper bound is not a lower bound on actual correlation error. The $q = 1$ Hamiltonian is not inserted into the summable family.
